

Landsaver

Containment & Fabrication Installation

"Customer Focused, Environmentally Committed Since 1984"

Geocomposite Clay Liners are constructed of two geotextiles encapsulating a layer of low permeability sodium bentonite to create an impermeable layer for use in ponds and landfills.

- Natural liners with minimal environmental impact
- Supplied in rolls for easy installation
- Self healing bentonite allows it to function even if punctured
- Reinforced for use on slopes, and non reinforced for use on flat areas.

Geomembranes provide an impermeable layer to prevent the passage of solids or liquids into the ground. Typical applications are waste containment, hazardous material and ponds.

Prefabricated liner panels are in stock and available for quick shipment.

- These panels are fabricated in multiple widths and are available in lengths of 200'
- Landsaver has 20, 30 and 40 mil PVC panels in stock and ready for shipment.
- Landsaver has many other types of materials in stock including XR-5, Hypalon and 36 Mil reinforced polypropylene.
- Custom widths and lengths in any of our materials are available upon request

Landsaver Environmental Installation Services

Hydroseeding, Hydro Mulch, Pond Clear, Terra Tubes, Erosion EELs, Turf Reinforcement Mats, Silt Fence, RockGuard Pipeline Mesh, Safety Fence, Articulated Concrete Blocks, GeoWeb
